

BIODIVERSITY ON SOLID GROUND

Hi, I'm Paloma the Shield Bug!

Come and learn about land-based habitats for biodiversity with me!

Paloma's Helpful Hint:

"Pssst... walk in the habitats I mentioned and keep your eyes peeled!"

A habitat is a place with unique features where different kinds of plants and animals like to live. A habitat could be a woodland, some grassland or even in the soil! I love living in the hedgerows.

Can you find all of the land loving plants, animals, insects and fungi in these pictures?

Use **#Biohunt** and share with us to win a prize!

Scavenger Hunt

Honey Bee

Elder tree
(with flowers)

Fox

Herb Robert

Blackbird

Red Clover

Elf Cup Lichen

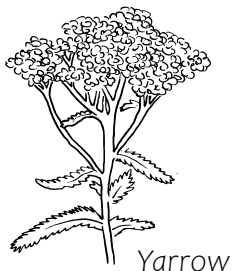

Hawthorn

Earthworm

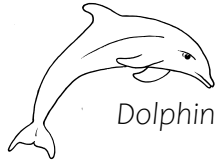

Yarrow

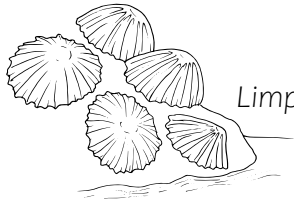

Marram Grass

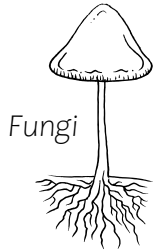

Hedgehog

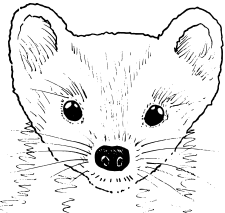

Dolphin

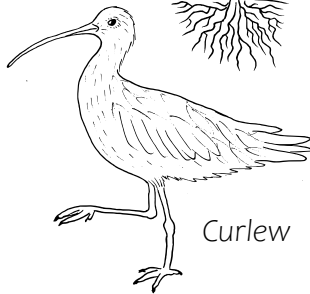

Limpets

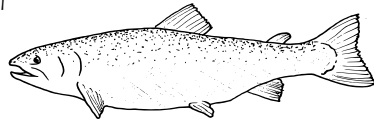

Fungi

Pine Marten

Curlew

Salmon

Freshwater
Rivers & Lakes

Grassland

Sea

Woodland

Rock Pools

Soil

Coastal
Sand Dunes

Bogland

Hedgerow

There are some plants and animals that only live in certain habitats. It's important to take care of all habitats so that they can have somewhere to live!

Can you help match the flora and fauna here to their correct habitat?

Did you see anything else on your adventure that you found interesting?
Draw a picture of it here!
